

Y5/6 – What variable gets changed?

A variable can be set and changed throughout the running of a program.

What happens when you add `change score by 1` to this code snippet in positions A, B, or C?

Test your predictions by adding the block.

Data type	A set of values and a set of operations defined on those values
Constant	Data values that stay the same every time a program is executed
Integer	Integers are numbers without a fractional component, and don't support decimal points
Strings	Most programming languages have a data type called a string, which is used for data values that are made up of ordered sequences of characters, such as "hello world". A string can contain any sequence of characters, visible or invisible, and characters may be repeated.
Program	A program is a specific set of ordered operations for a computer to perform.

Use easy to remember titles for variables so they are easier to follow and understand
